

CF No Debug Gets A Little Smarter

Related Categories: Tools, CF No Debug, ColdFusion

Last week I updated my **CF No Debug** extension so that it will remember what state it was last in when you open Firefox. Before, when you closed and re-opened Firefox the extension was always disabled, allowing ColdFusion request debugging to execute. Now if you have the extension enabled when you close Firefox, it will remain enabled when you open Firefox again. This is an extension only update, so there is no need to update the servlet filter.
